

INNOVATIONS in hygiene at a nursing home in Austria.

CASE STUDY
Haus an der Traisen
St. Pölten

Since 2014, the Haus an der Traisen nursing home in St. Pölten have supplemented their existing hygiene protocols with Novaerus air purification units to help control infection and reduce odour.

PROBLEM

Haus an der Traisen is home to several patients who have malignant diseases with large ulcerating tumours. Changing the bandages on these tumours each day is time-consuming, stressful and unpleasant for both carers and patients due to the unpleasant odours produced by the wound. In the past, the nursing home would use essential oils in an attempt to cover up the odour. However, both patients and carers often complained that the scent of the oils was too strong or unpleasant, especially for patients whose sense of smell and taste was changed as a result of chemotherapy treatments.

The nursing home was also concerned about infections being transmitted to staff and other residents from patients with a known infection such as MRSA, despite these patients being housed in individual rooms.

CASE STUDY Haus an der Traisen, St. Pölten

SOLUTION

Haus an der Traisen deployed Novaerus NV200 portable devices in single patient rooms and the NV800 in the outpatient facility and physiotherapy room where larger groups of patients congregate.

Novaerus devices use NanoStrike™ technology to safely and gently deactivate airborne pathogens and microorganisms at the DNA level resulting in lower risk of infection being transmitted via the air, surfaces and hands, and noticeably reduced odours.

*"It isn't as stuffy as before ...
I can't quite put my finger on it ...
it's just fresher somehow. ."*

RESULTS

Following an initial trial period, the feedback from carers and patients was overwhelmingly positive. Carers even demanded that the nursing home continue to use the Novaerus devices to maintain a more hygienic and safe environment for themselves and their patients.

Carers and patients reported that the odour from an hour-long bandage change was significantly reduced with continuous use of Novaerus device, making the experience less stressful and more comfortable and improved patients' sense of wellbeing.

Carers reported the Novaerus devices to be extremely easy to use and maintain, and quiet enough so as not disturb the hospice patients.
